

This use is not appropriate for this band. Interference from existing users (Up to 1.5KW) must be allowed at all times and places. A single device may not be a problem, but thousands of them in a warehouse will generate a large amount of noise to existing spectrum users near by. Move this use to an existing licensed commercial band. I do not believe this will be compatible with the amateur radio services in large metropolitan areas. Ensure the operators of this device in a licensed band are responsible for interference in the band of operation, as well as interference to other bands.
